

## Press release September 2017

### *Digital Padlock Ensures Safety*

#### **ITConcepts Automotive: Additional merger with encryption specialist digitronic®**

**Wolfsburg/Chemnitz** September 2017 ---- **The life of data thieves just got harder, as another specialist in the field of IT encryption has joined Wolfsburg's ITConcepts Automotive as a partner. By doing so, digitronic® closes an important loophole – for the benefit of the customer.**

#### **Data theft – not under our watch**

Operating procedures are digitally displayed, handled and saved in all companies. Every employee has access to them. Quite often, the highly sensitive data is not always retrieved by authorised personnel. But is there really a way to secure this data from being stolen by unauthorised persons? In that case, the only help is a kind of "digital padlock" that reliably encrypts the data and only gives access to authorised personnel. ITConcepts Automotive and digitronic® can provide this security. "Our experts have the necessary and certified know-how," says Gernot Joswig, authorised officer at ITConcepts Automotive. "This way, we make sure that we are able to advise you in terms of IT security in a focused and comprehensive manner. In order to focus on the technical implementation, we consult experts and then work together on a customised solution – for the benefit of our shared customers!"

#### **All companies, be they large or small, have to protect themselves**

People often underestimate the fact that large companies are not the only ones getting hacked. Creative industries such as product and prototype development or marketing and advertisement agencies are particularly at risk. Apart from human misconduct, another fatal problem is that more and more malware unnoticeably passes on confidential data from servers to international data thieves. Professionally established "Big Data Analysis Tools" deliberately attempt to extract important information and sell it on the "grey market". However, with the help of All-In-One Compliance Packages, all the data is already encrypted on the server (see our product HiCrypt™ 2.0) and comfortable teamwork is still possible. Furthermore, our different types of certified security keys lead to a high level of comfort while also providing additional logon security (Secure Logon™ 2.0).

**Successful cooperation among automotive suppliers**

Gernot Joswig, authorised officer at ITConcepts Automotive and Matthias Kirchhoff, manager of digitronic<sup>®</sup>, are both deeply satisfied with the previously executed orders in the automotive supplier industry. They also want to provide powerful solutions to the field of healthcare and the energy market. "Our present and future customers will benefit from the combined know-how of our companies, as information security needs to maintain the confidentiality, availability and integrity of data," say IT specialists Joswig and Kirchhoff.
