

Secure logon solutions for hospitals

Login to devices and applications without password frustration

We are your German-certified partner for IT security and help to ensure that ...

- ... PC workstations are no longer left unattended open
- ... each device is protected by a secure 2-factor authentication solution
- ... logging on to PCs and specialist applications works easily and securely without password frustration
- ... known work processes and tools be maintained for the most part

Can be used immediately or step by step

Together with our customers in the medical sector, we have developed instant technical solutions that enable employees to log on and log off PCs and applications quickly, thus reliably protecting confidential data. The solutions can be implemented step by step and do not require any major changes to your IT infrastructure.

This is what we can do for you

- ✓ Convenient logon and logoff at the workstation PC (also at station PCs with frequent user changes)
- ✓ Convenient login and logout to the various applications without password frustration
- ✓ Lean, technical solutions with extremely high protective effect
- ✓ Low conversion effort for your employees
- ✓ Logging of all logins and assignment to the user profile
- ✓ Step by step introduction with targeted measures

Our promise as a manufacturer

All solutions from our company have been developed on the basis of concrete requirements and needs from practice. The solutions therefore already include many individual configuration options. As a manufacturer, however, we are also happy to work with you to develop customizations that best meet your specific requirements.

Secure logon solutions for hospitals

In 3 steps to login without password frustration

Fast and secure login and logout to PCs using 2-factor authentication

Replace the standard Windows login for your employees with 2-factor authentication. Forget long, complicated passwords or open PCs. The solution can be implemented at any number of workstations very quickly. In addition, at highly frequented station PCs, all logins can be logged and assigned to the respective user profile. The devices are logged out or locked automatically.

Practical scenario (example station PC)*:

- PC logon by means of authentication feature (token) and short PIN
- Suitable tokens** include smartcards, transponders, USB or Bluetooth tokens and smartphones
- Logging of all logins and assignment to the respective user profile
- Open individual applications according to the user profile
- Automatic logout or lockout when removing the token or leaving the device

* The above practical scenario is just one example. Workflow and functions can be flexibly adapted to your requirements.

** If you already have hardware in the form of transponders or similar for locking systems, we will be happy to check compatibility for you in order to avoid the need to purchase additional hardware

Secure logon solutions for hospitals

In 3 steps to login without password frustration

Fast and secure logon to local installations and web portals

Constant logging in and out of the various hospital information systems is a major challenge for staff. For IT security reasons, it is extremely important to also protect the individual applications from unauthorized access.

By integrating a KeePass plugin into our 2-factor authentication solution, your staff will also be able to log on to local installations as well as web portals after securely logging on to the workstation PC with just a few clicks and without password frustration.

Practical scenario (example station management)*:

- Station management logs in via 2-factor-authentication with token**
- According to the user profile, the KeePass database and other applications are opened for the execution of the respective work processes (e.g. master data maintenance, accounting and communication systems, etc.)
- The login data for the individual applications can be transferred to the login masks with a click
- Automatic logout of all open applications or locking of the PC when removing the token or leaving the device

* The above practical scenario is just one example. Workflow and functions can be flexibly adapted to your requirements.

** If you already have hardware in the form of transponders or similar for locking systems, we will be happy to check compatibility for you in order to avoid the need to purchase additional hardware

Secure logon solutions for hospitals

In 3 steps to login without password frustration

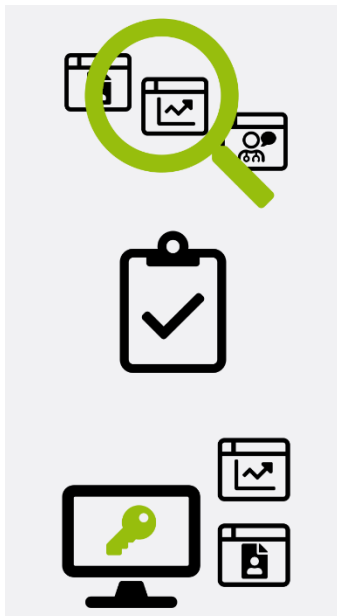

Analysis of the main applications and creation of interfaces for fully automatic registration

The steps described above do not require any major intervention in your IT infrastructure or regular follow-up work after system updates. The solutions are installed in a few minutes, can be conveniently rolled out and managed centrally, and can be integrated into your existing infrastructure. The desired plug-ins and features can be configured piece by piece.

In some cases, however, it may make sense to think about creating interfaces to main applications that are as long-term stable as possible. Here, too, we take a step-by-step approach.

Practical scenario:

- Analysis of the systems and applications behind the specialist procedures
- Design and implementation of stable interfaces between the main applications
- Automated transfer of credentials to the identified main applications

We would be happy to assist you with any or all of the above steps towards a secure and convenient registration solution. Just get in touch with us.
